

FRESH AIR AND FIRE PROTECTION COMBINED

The SMOKEJET, MULTIJET louvre ventilators and the roda louvre window combine the functions of natural ventilation and smoke and heat exhaust ventilation. Due to the high quality of roda products and their design for a high number of opening and closing operations, the above-mentioned ventilators can also be used to their full extent as smoke and heat exhaust ventilation in addition to their function for daily ventilation.

If, in addition to the heat and smoke exhaust ventilation function, the louvre ventilator is also to be suitable for ventilation in all weathers, the MULTIJET multi-purpose ventilator is the right choice. In fine weather, it opens the louvres and thus uses the entire available opening area. When it rains, these close and the inner flaps open.
